1. Introduction

The interaction of an electromagnetic field with structural particles in the electrodynamics of hadrons is based on the main principles of relativistic quantum field theory. In the model conceptions, where basically the diagram technique is used, a number of features for the interaction of photons with hadrons have been determined [1, 2]. However, the diagram technique is mainly employed for the description of electromagnetic processes in the simplest quark systems. In the case of interaction for the electromagnetic field with complex quark-gluon systems in the low-energy region, the perturbative methods of QCD are nonapplicable. That is why, the low-energy theorems and sum rules were widely used lately [3–6]. In the present time, the low-energy electromagnetic characteristics which are connected with a hadron structure, such as the formfactor and polarizabilities, can be obtained from nonrelativistic theory [5]. Passing from the nonrelativistic electrodynamics to the relativistic field theory, one can use the correspondence principle. But it is necessary to investigate, step-by-step, a transition from the covariant Lagrangian formalism to the Hamiltonian one [7–9].

The determination of the interaction vertex of $\gamma$-photons with protons taking the polarizabilities into account [10] has recently been used to fit experimental data on the Compton scattering on a proton in the energy neighborhood of a birth of the $\Delta(1232)$-resonance [11].

This work is a continuation of the researches which have been presented in our previous articles [6–8]. Using the covariant Lagrangian of interaction of the electromagnetic field with a structural polarizable particle, the equations of motion and the canonical and metric energy-momentum tensors have been obtained.

2. Total Lagrangian

The total Lagrangian of the interaction of spin-1/2 particles with the electromagnetic field consists of the Lagrangian for the free electromagnetic field $L_{e-m}$, the spinor or Dirac field $L_D$, the Lagrangian of the interaction of the free electromagnetic field with the Dirac field $L_{int-D}$, and the Lagrangian which considers electric and magnetic polarizabilities of particles $L_{\alpha_0\beta_0-D}$:

$$L_{total-D} = L_{e-m} + L_D + L_{int-D} + L_{\alpha_0\beta_0-D},$$

thus,

$$L_{total-D} = -\frac{1}{4} F_{\alpha\beta} F^{\alpha\beta} + \bar{\psi} \left( \frac{1}{2} i \gamma_\alpha \vec{\partial}^\alpha - m \right) \psi - e(\bar{\psi} \gamma_\alpha \psi) A^\alpha + K_{\sigma\nu} \Theta^{\sigma\nu},$$

where

$$K_{\sigma\nu} = \frac{2\pi}{m} \left( \alpha_0 F_{\sigma\mu} F^{\mu\nu} + \beta_0 F_{\sigma\mu} \tilde{F}^{\mu\nu} \right),$$

$$\vec{\partial}_\nu \rightarrow \partial_\nu - \frac{e}{\sqrt{2}} A_\nu.$$
\[ \Theta^{\sigma \nu} = i \left( \bar{\psi} \gamma^\sigma \partial^\nu \psi \right). \]

\( \psi \) is the wave function of spin-1/2 particles.

In this expression \( \bar{F}_{\mu \nu} = \frac{1}{2} \varepsilon_{\mu \nu \rho \sigma} F^{\rho \sigma} \), where \( F_{\mu \nu} \) and \( \bar{F}_{\mu \nu} \) are the tensors of the electromagnetic field, \( \alpha_0 \) and \( \beta_0 \) are electric and magnetic polarizabilities, and \( \varepsilon_{\mu \nu \rho \sigma} \)–Levi-Civita antisymmetric tensor \( (\varepsilon^{0123} = 1) \).

The part of the Lagrangian with polarizabilities can be rewritten as
\[ L^{(\alpha \beta)} = -\frac{1}{4} F_{\mu \nu} G^{\mu \nu} = K_{\sigma \nu} \Theta^{\sigma \nu}, \] (2)
where \( G^{\mu \nu} \) is the antisymmetric tensor \( G^{\mu \nu} = -G^{\nu \mu} \) and is equal to
\[ G^{\mu \nu} = \frac{\partial L^{(\alpha \beta)}}{\partial (\partial_{\mu} A_{\nu})} = \frac{4\pi}{m}((\alpha_0 + \beta_0)(F^{\mu \nu} \tilde{\Theta}^{\mu \nu} - F^{\mu \mu}_{\nu} \tilde{\Theta}^{\mu \nu} \beta_0) \Theta^{\mu \nu} F^{\nu \nu}), \] (3)
where \( \tilde{\Theta}^{\mu \nu} = 1/2(\Theta^{\mu \nu} + \Theta^{\nu \mu}) \).

3. Equations of Motion

For the interaction of the spinor and electromagnetic fields, the following system of equations is used:
\[ -\frac{\partial L}{\partial A_{\mu}} + \partial_{\nu} \frac{\partial L}{\partial (\partial_{\nu} A_{\mu})} = 0, \] (4)
\[ -\partial L + \partial_{\nu} \frac{\partial L}{\partial (\partial_{\nu} \psi)} = 0, \] (5)
\[ -\partial L + \partial_{\nu} \frac{\partial L}{\partial (\partial_{\nu} \psi)} = 0, \] (6)
where \( A_{\mu} \) is the vector-potential of the electromagnetic field.

From Lagrangian (1) and expressions (4–6), we get the equations of motion for a charged spin-1/2 particle with \( \alpha_0 \)-electric and \( \beta_0 \)-magnetic polarizabilities:
\[ \partial_{\mu} F^{\mu \nu} = e \bar{\psi} \gamma^\nu \psi - \partial_{\mu} G^{\mu \nu}, \] (7)
\[ (i\gamma \nu \partial_\nu m)\psi + e A_\nu \gamma^\nu \psi - \frac{i}{2} (\partial^\nu K_{\sigma \nu} \gamma^\sigma) \psi - i K_{\sigma \nu} \gamma^\sigma \partial^K \psi - \bar{\psi} (i \gamma \nu + m) - e \bar{\psi} A_\nu \gamma^\nu - \frac{i}{2} \bar{\psi} (\partial_K K_{\sigma \nu} \gamma^\sigma) - i (\partial^\nu \psi) \gamma^\sigma K_{\sigma \nu}. \] (8)

In expression (7), \( e \bar{\psi} \gamma^\nu \psi \) is the current associated with a charge, \( -\partial_{\mu} G^{\mu \nu} \) is the current associated with the polarizabilities of the particle.

Following work [12], we perform a relativistic generalization of the phenomenological energy-momentum tensor of the interaction of the electromagnetic field with a polarizable particle as
\[ T^{\mu \nu} = T^{\mu \nu}_0 + T^{\mu \nu}_\text{int}. \] (10)

Lagrangian (1) takes the form
\[ L_{\text{total} - D} = L_0 + L_{\text{int}}, \] (11)
where
\[ L_0 = -\frac{1}{4} F_{\alpha \beta} F^{\alpha \beta} + \bar{\psi} \left( \frac{1}{2} i\gamma_\alpha \partial^K \gamma^\alpha - m \right) \psi \]
is the usual Lagrangian, and
\[ L_{\text{int}} = -e \bar{\psi} \gamma_\alpha \psi A^\alpha + K_{\sigma \nu} \partial_\nu \psi \]
is the interaction Lagrangian of the electromagnetic field and a particle with polarizabilities.

With the help of Lagrangian (11), the canonical energy-momentum tensor looks like
\[ T^{\mu \nu}_\text{can} = \frac{\partial L_0}{\partial (\partial_\nu A_\mu)} (\partial^K A_K) + \partial^K \bar{\psi} \frac{\partial L_0}{\partial (\partial_\nu \psi)} + \frac{\partial L_0}{\partial (\partial_\nu A_\mu)} \partial^K \psi - \frac{g^{\mu \nu}}{4} \left( (\frac{1}{4} F_{\alpha \beta} F^{\alpha \beta} - \frac{1}{4} F_{\alpha \beta} G^{\alpha \beta}) \right). \]
As a result, we get
\[ T^{\mu \nu}_\text{can} = T^{\mu \nu}_\text{can(0)} + \frac{g^{\mu \nu}}{4} G_{\rho \sigma} F^{\rho \sigma}, \] (12)
where \( \frac{g^{\mu \nu}}{4} G_{\rho \sigma} F^{\rho \sigma} \) is the energy-momentum tensor of the interaction of the electromagnetic field with regard for the polarizabilities of the particle, and
\[ T^{\mu \nu}_\text{can(0)} = -F^{\mu \nu} \partial^K A_K + \frac{g^{\mu \nu}}{4} F_{\rho \sigma} F^{\rho \sigma} + G^{\mu \nu}. \]

Using the unambiguously defined energy-momentum tensor for \( T^{\mu \nu}_\text{can} \), we construct the metric energy-momentum tensor:
\[ T^{\mu \nu}_\text{metr} = T^{\mu \nu}_\text{can(0)} + \partial_\rho (F^{\mu \rho} A^K) + \frac{g^{\mu \nu}}{4} G_{\rho \sigma} F^{\rho \sigma}. \] (13)

Thus, \( T^{\mu \nu}_\text{metr} \) reads
\[ T^{\mu \nu}_\text{metr} = F^{\mu \rho} F^\nu_\rho + \frac{g^{\mu \nu}}{4} F_{\rho \sigma} F^{\rho \sigma} + G_{\mu \nu}. \]
where $j^\mu$ is the current density of the charged particle.

In the rest frame of the particle, we obtain the energy density of interaction for the particle with polarizabilities and the electromagnetic field:

$$\mathcal{E} = -\frac{2\pi}{m} \Theta^{00}(\alpha_0 E^2 + \beta_0 H^2),$$

where $\Theta^{00}$ is the energy density of the spin-1/2 particle.

4. Conclusion

Taking the covariant Lagrangian of interaction of the electromagnetic field with a polarizable spin-1/2 particle as a basis in the Lagrangian covariant formalism, the equations of motion have been found. The correlations between the covariant Lagrangian and the canonical and metric energy-momentum tensors have been obtained. In the rest frame of the particle, the energy density of interaction for the particle with polarizabilities and the electromagnetic field has been determined.
